

Trusting No One, Getting Nowhere: Soft Policy and the Janus-Faced Nature of Social Capital in Evacuation Networks

[Code](#)

Replication Code

Timothy Fraser, Northeastern University

February 19, 2021

This study tests what factors drive evacuation. We estimate evacuation using data from Facebook Data for Good. Their project tallies up the number of Facebook users who were identified to be in the disaster hit area consistently two weeks prior to the disaster. Then, they tally up how many people went from any neighborhood in that region to any other neighborhood. Unfortunately, this data is measured at the neighborhood level, using special polygons. This is not a level joinable with census data, and by data sharing agreement, the researchers cannot share the original raw data without permission from Facebook. So, to remedy both these issues, we aggregated everything up from the neighborhood level to the census tract level. This is described in detail in `fb_network_maker_code.Rmd`. While we can't share the original base data, located in the `fb_data` folder, we can share all other data for replication, which we describe below!

0. Packages

First, let's load some packages!

[Hide](#)

```
library(tidyverse) # for tidy data manipulation
# Using the most recent version of dplyr, we can bind_rows() for sf objects
# Download the most recent version here:
# library(remotes)
# remotes::install_github("tidyverse/dplyr")
library(dplyr)
library(dtplyr) # for dplyr functions with data.table, the speedy data manipulation package
library(ggeffects)
# GIS packages
library(sf) # for tidy spatial data
library(rgdal) # for spatial operations
library(tigris) # for accessing census boundaries
library(tidycensus) # for downloading census data
library(censusapi) # for downloading census data
# Networks Packages
library(tidygraph)
library(ggraph)
#remotes::install_github("luukvdmeer/sfnetworks")
library(sfnetworks)
library(gstat)
```

1. Building the Network

1.1 Gather Social Vulnerability Index

Hide

```
# We downloaded the CDC's Social Vulnerability Index at the census tract level
# for the year 2018 from the following location on Sun, November 22, 2020:
# https://www.atsdr.cdc.gov/placeandhealth/svi/data_documentation_download.html

# First, resave into .rds format, for quicker access
read_csv("raw_data/covariates/SVI2018_US.csv") %>%
  select(fips = FIPS, state = ST_ABBR,
         # Grab the SVI
         svi = RPL_THEMES,
         # Grab the four subindices
         svi_socioeconomic = RPL_THEME1, # Socioeconomic - RPL_THEME1
         svi_household_disability = RPL_THEME2, #Household Composition & Disability - RP
L_THEME2
         svi_minority = RPL_THEME3, #Minority Status & Language - RPL_THEME3
         svi_housing_transport = RPL_THEME4 # Housing Type & Transportation - RPL_THEME4
         ) %>%
  # -999 means no data, so let's remove those
  mutate_at(vars(svi:svi_housing_transport),
            funs(if_else(. == -999, NA_real_, .))) %>%
  # and save in a more comfortable file format
  saveRDS("raw_data/covariates/svi_tract.rds")
```

County subdivision

Hide

```

# Load packages
library(tidyverse)
library(tigris)
library(sf)
library(rgdal)

# Aggregate census tract measures to zipcode level
aggregate_csub = function(MYSTATE){

1.4 FEMA

Additionally, the levels of soft and hard infrastructure investment in each community could play a big role in evacuation. For example, if FEMA has spent lots of money developing a civilian community response team, that could really help with evacuation. Or if they have spent considerable funds in hazard mitigation, that could help as well. Let's mine FEMA's excellent geocoded data for these kinds of information.

CERT (Community Emergency Response Teams)

Let's import FEMA's Community Emergency Response Team dataset Found here:

https://www.fema.gov/sites/default/files/2020-08/fema_community-emergency-response-team_09-18-2015_0.xlsx
(https://www.fema.gov/sites/default/files/2020-08/fema_community-emergency-response-team_09-18-2015_0.xlsx) And at this site: <https://www.fema.gov/about/openfema/data-sets/community-emergency-response-team-cert-dataset> (<https://www.fema.gov/about/openfema/data-sets/community-emergency-response-team-cert-dataset>)

Hide

```

dat <- readxl::read_excel("raw_data/covariates/fema/fema_community-emergency-response-te
am_09-18-2015_0.xlsx", sheet = 3) %>%
# Simplify column names
magrittr::set_colnames(value = names(.) %>% tolower() %>%
                        str_replace_all(" [(|)|]|[/]|[,]|["], "_" ) %>%
                        str_replace_all("_", "-")) %>%

mutate(id = 1:n()) %>%
select(id, name = name_of_cert_program, state = cert_program_state,

EMPG (Emergency Management Performance Grants)

Description from website: "This dataset contains EMPG recipients as reported by their State and a summary of the funded program support as reported by the Recipient in the Grants Reporting Tool (GRT).

The EMPG Program provides resources to assist state, local, tribal and territorial governments in preparing for all hazards, as authorized by Section 662 of the Post Katrina Emergency Management Reform Act (6 U.S.C ' 762) and the Robert T. Stafford Disaster Relief and Emergency Assistance Act, as amended (42 U.S.C. " 5121 et seq.). Title VI of the Stafford Act authorizes FEMA to make grants for the purpose of providing a system of emergency preparedness for the protection of life and property in the United States from hazards and to vest responsibility for emergency preparedness jointly in the federal government and the states and their political subdivisions. The FY 2016 EMPG will provide federal funds to assist state, local, tribal and territorial emergency management agencies to obtain the resources required to support the National Preparedness Goal's (NPG's) (the Goal's) associated mission areas and core capabilities. The federal government, through the EMPG Program, provides necessary direction, coordination, and guidance, and provides necessary assistance, as authorized in this title to support a comprehensive all hazards emergency preparedness system.

The Emergency Management Performance Grant Program is to support a comprehensive, all-hazard emergency preparedness system by building and sustaining the core capabilities contained in the National Preparedness Goal.

Examples include:

- Completing the Threat and Hazard Identification and Risk Assessment (THIRA) process;
- Strengthening a state or community's emergency management governance structures;
- Updating and approving specific emergency plans;
- Designing and conducting exercises that enable whole community stakeholders to examine and validate core capabilities and the plans needed to deliver them to the targets identified through the THIRA;

-Targeting training and verifying identified capabilities;

-Initiating or achieving a whole community approach to security and emergency management."

NHS (National Household Survey)

The National Household Survey (NHS) tracks progress in personal disaster preparedness through investigation of the American public's preparedness actions, attitudes, and motivations. FEMA administers the survey in English and Spanish via landline and mobile telephone to a random sampling of approximately 5,000 adult respondents. The survey includes a nationally representative sample as well as hazard-specific oversamples which may include earthquake, flood, wildfire, hurricane, winter storm, extreme heat, tornado, and urban event. FEMA delays publishing the data until approximately the release of the summary results for the subsequent NHS iteration. For example, FEMA published the 2017 data package at approximately the same time as the publication of the 2018 NHS Summary.

Each zip file may include an analysis summary, the survey instrument, raw weighted and unweighted data, aggregated data analysis, and a codebook with weighting overviews.

Raw Data: Datasets may include unedited raw data. As such, users should plan to clean the data as needed prior to analysis.

Citation: Users should cite the date the data was accessed or retrieved from fema.gov. In addition, users must clearly state that "FEMA and the Federal Government cannot vouch for the data or analyses derived from these data after the data have been retrieved from the Agency's website."

Hazard Mitigation Grants

<https://www.fema.gov/openfema-data-page/hazard-mitigation-assistance-mitigated-properties>
(<https://www.fema.gov/openfema-data-page/hazard-mitigation-assistance-mitigated-properties>)

September 9, 2020 version 1

This dataset contains the properties that were mitigated by projects funded under the Hazard Mitigation Assistance (HMA) grant programs. FEMA administers three programs that provide funding for eligible mitigation planning and projects to reduce disaster losses and protect life and property from future disaster damages. The three programs are the Hazard Mitigation Grant Program (HMGP), Flood Mitigation Assistance (FMA) grant program, and Pre-Disaster Mitigation (PDM) grant program. This dataset also contains data from the HMA grant programs that were eliminated by the Biggert Water Flood Insurance Reform Act of 2012 (BW-12): Repetitive Flood Claims (RFC) grant program and Severe Repetitive Loss (SRL) grant program. For more information on the Hazard Mitigation Assistance grant programs, please visit: <https://www.fema.gov/hazard-mitigation-assistance> (<https://www.fema.gov/hazard-mitigation-assistance>).

The dataset contains properties by project identifier, city, zip code, state and region and does not contain any Personally Identifiable Information (PII). The mitigated property dataset can be joined to the OpenFEMA Hazard Mitigation Assistance Funded Project dataset by the Project Identifier field. Note, not all projects in the Hazard

Mitigation Assistance Funded Project dataset will have mitigated properties (e.g., Planning and Management Cost projects). In some cases data was not provided by the subgrantee (sub-recipient), grantee (recipient) and/or entered into the FEMA mitigation grant systems. The information is likely available as part of the paper file which is considered the file of record.

This is raw, unedited data from FEMA's mitigation grant systems (NEMIS-MT and e-Grants) and as such is subject to a small percentage of human error. The financial information is derived from FEMA's mitigation grant systems and not FEMA's official financial systems. Due to differences in reporting periods, status of obligations and how business rules are applied, this financial information may differ slightly from official publication on public websites such as <http://www.usaspending.gov> (<http://www.usaspending.gov>); this dataset is not intended to be used for any official federal financial reporting.

Missing values - In some cases data was not provided by the subgrantee (subrecipient), grantee (recipient) and/or entered into the FEMA mitigation grant systems. The information is likely available as part of the paper file which is considered the file of record.

A newer version of this OpenFEMA data set has been released. This older dataset version will no longer be updated and will be archived by the end of April 2020. The following page details the latest version of this data set: <https://www.fema.gov/openfema-dataset-hazard-mitigation-assistance-mitigated-properties-v2> (<https://www.fema.gov/openfema-dataset-hazard-mitigation-assistance-mitigated-properties-v2>). CSV and JSON Files can be downloaded from the 'Full Data' section.

To access the dataset through an API endpoint, visit the 'API Endpoint' section of the above page. Accessing data in this fashion permits data filtering, sorting, and field selection. The OpenFEMA API Documentation page provides information on API usage.

If you have media inquiries about this dataset, please email the FEMA News Desk FEMA-News-Desk@dhs.gov (<mailto:FEMA-News-Desk@dhs.gov>) or call (202) 646-3272. For inquiries about FEMA's Hazard Mitigation Assistance grant program data and Open government program, please contact the OpenFEMA team via email OpenFEMA@fema.dhs.gov (<mailto:OpenFEMA@fema.dhs.gov>) and FEMA-HMAAnalytics@fema.dhs.gov (<mailto:FEMA-HMAAnalytics@fema.dhs.gov>).

1.5 Rainfall

Next, we're going to approximate how much rain fell in each census tract every week during our study period.

NOAA has an excellent dataset hosted by the Global Historical Climatology Network (<https://www.ncdc.noaa.gov/data-access/land-based-station-data/land-based-datasets/global-historical-climatology-network-ghcn> (<https://www.ncdc.noaa.gov/data-access/land-based-station-data/land-based-datasets/global-historical-climatology-network-ghcn>)). GHCN "is an integrated database of climate summaries from land surface stations across the globe that have been subjected to a common suite of quality assurance reviews. The data are obtained from more than 20 sources. Some data are more than 175 years old while others are less than an hour old." They host data on an FTP server that contains daily precipitation, broken into yearly datasets (ftp://ftp.ncdc.noaa.gov/pub/data/ghcn/daily/by_year/ (ftp://ftp.ncdc.noaa.gov/pub/data/ghcn/daily/by_year/)). A README file is available here (https://www1.ncdc.noaa.gov/pub/data/ghcn/daily/by_year/readme.txt (https://www1.ncdc.noaa.gov/pub/data/ghcn/daily/by_year/readme.txt)). The locations of recording stations is available here (<https://www1.ncdc.noaa.gov/pub/data/ghcn/daily/ghcnd-stations.txt> (<https://www1.ncdc.noaa.gov/pub/data/ghcn/daily/ghcnd-stations.txt>)), and we can use these to locate and spatially interpolate these rainfall levels.

The journal article describing GHCN-Daily is: Menne, M.J., I. Durre, R.S. Vose, B.E. Gleason, and T.G. Houston, 2012: An overview of the Global Historical Climatology Network-Daily Database. *Journal of Atmospheric and Oceanic Technology*, 29, 897-910, doi:10.1175/JTECH-D-11-00103.1 (doi:10.1175/JTECH-D-11-00103.1).

To acknowledge the specific version of the dataset used, please cite: Menne, M.J., I. Durre, B. Korzeniewski, S. McNeal, K. Thomas, X. Yin, S. Anthony, R. Ray, R.S. Vose, B.E. Gleason, and T.G.
